ENHANCED ADMINISTRATION

for Microsoft Dynamics 365

administration

- Users and employee data automated synchronization

ENHANCED ADMINISTRATION
Users and employee data automated synchronization

Feature enabling the automatic creation and maintenance of employee and user data in Microsoft Dynamics 365 based on the interface with Azure Active Directory (AAD).

Entering users and employees in Dynamics 365 is necessary for the smooth running of all ERP processes.
The creation and maintenance of this data in standard is not automated.
Enhanced administration automates the employee and user creation process in use cases where employees are managed by HR in a separate HR information system, and users are managed by IT in the AAD as a central solution for all business applications.

Functions

Interface	Interface with Azure Active Directory and automated transaction creation that updates data in Dynamics 365.
Update	Automatic creation of employee and user data as well as associated data (resources, suppliers, positions in the organizational hierarchy, etc.) according to settings and mapping tables.
Visualization	View transactions from the Azure Active Directory and their status. Ability to restart the update of a transaction in error after correction.

Benefits

Simpler for both HR and IT

- HR users manage employees in their HR information system only.

- IT system administrators manage users in the AAD only.

- No redundant data entry
