Integration Solution

Workin *Sync* 365

Complementary to
Microsoft Azure, DevOps and Power Platform

Designed for
All Organizations

- Easily extensible development foundation to cover your specific integration needs
- Centralized integration flows
- Wide range of connectors available as standard in Microsoft Azure
- Optimized data processing

Benefits

Development Solution with low licenses cost, easily scalable according to your specific requirements

- **An affordable middleware solution**
- **A configuration management solution to quickly meet integration challenges**

Easily extensible development platform to cover your specific integration needs

A middleware development foundation based on Microsoft Azure, DevOps and Power Platform, designed around an architecture with clearly identified generic components.

Each component has its own field of action and can be shared between all integration flows.
It facilitates the creation of context-specific integrations and allows a high level of configuration.
It applies best practices and provides a **common framework for all developers**.

Features

Visualization	Intuitive graphical interface for visualizing all executed processes.
Accessibility	Configure inputs and flow parameters with a user-friendly application.
Configuration	Define all triggers and sequence of actions to be executed for an integration flow.
Update	Automated deployment for improved version and configuration management.

Centralized integration flows

All middleware components are managed in Microsoft Azure, DevOps and the Power Platform, ensuring simplicity and consistency.

Centralization provides an overview of flows and improves management of standardized monitoring and security.

Benefits

Improves coordination between systems

- **IT teams have a centralized service for faster and more detailed data analysis**
- **Resources are pooled to keep pace with changing needs and to optimize costs**
- **Systems benefit from greater compliance and better governance**

Features

Communication	Combine and orchestrate multiple integration flows.
Development	A pre-established development process to guide infrastructure evolution and simplify implementation.
Monitoring	The monitoring management solution allows you to view all activity logs in one central location.Be alerted to any incidents so you can correct them quickly.
Configuration	The WorkinWith application supplied with the Accelerator enables complete system management.
Update	In the event of exchanges, an application allows files to be archived or deleted according to the source system's strategy and can be adapted to each integration flow.

Wide range of connectors available as standard in Microsoft Azure

Connects most systems and applications on the market. Infrastructure and development Solution based on Azure, DevOps and Power Platform to manage a wide range of integration scenarios needed by companies.

Access to the platform will enable you to benefit from most innovations and to keep your systems up to date with the latest market technologies.

Benefits

This Solution offers numerous advantages for business process integration and automation

- **The wide range of services and protocols for third-party systems, such as Microsoft Dynamics, SQL Server, SAP, Salesforce, Oracle, SFTP, REST, OData AS2, to name the most popular, enables extensive connectivity.**
- **Enable users to monitor workflow performance in real time, detect errors and bottlenecks, and take prompt corrective actions.**

Features

Update	Take advantage of Azure Standard connectors using different exchange protocols
Assisted configuration	Dynamic actions can be configured according to customer strategy
Connecting systems	Logic Apps uses the wide range of connectors (over 800 available) to obtain data from external systems, including Microsoft Dynamics 365 ERP and CRM.
Managing complex processes	Manage common transformation and integration requirements by flow using Logic Apps only; or more complex ones, using Azure Data Factory, Synapse Analytics or Azure Function

Optimized data processing

Workin Sync 365

Infrastructure and development Solution based on Azure, DevOps and Power Platform to manage a wide range of integration scenarios needed by companies.

An architecture with clearly identified generic components.
Each component has its own field of action and can be shared between all integration flows.
They facilitate the creation of context-specific integration and allow a high level of configuration.
They apply best practices and provide a common framework to all developers.

Benefits

Optimized use of your data

- **Provides valuable operational information for more informed decision-making**
- **Optimizes business processes by identifying and correcting inefficiencies to optimize operations, reduce costs and improve team productivity**

Features

Lifecycle	Complete versioning, testing and validation before production deployment.
Automation	Deployments requiring minimum manual actions.
Storage	All entries in a dedicated Blob Storage folder ensure a high level of traceability of all information used by a flow execution.
Cleaning	File deletion/archiving based on source system strategy, adaptable to each integration flow.
Securing	Secured access to all environments

Highlights at a glance

Workin Sync 365 is an architecture that provides unified services and functionalities to applications, enabling both development and operation teams to build and deploy applications more efficiently.

Benefits

A middleware solution that's affordable and easy to supervise

- **Time saving for your IT teams**
- **Improves system coordination and productivity**
- **Flexible solution**
- **Extended connectivity and compliance**
- **Optimized use of your data**

Workin Sync 365 provides::

- Provision of a complete integration solution in just a few hours
- Use of a stable, agile, future-proof architecture that limits re-engineering efforts
- Access to expertise in our middleware team, who shares its skills to your IT teams
- Clear vision of the project planning and progress
- Estimate of support and upgrade costs, allowing you to get a framed middleware budget.
- Savings based on risk reduction and innovation
